Bank Balance Sheets and Monetary Transmission:

The Impact of Negative Household Deposit Rates (Job Market Paper)

How do negative interest rates on household deposits impact bank balance sheets and the transmission of monetary policy? To explore this question, I perform a staggered difference-in-differences analysis using novel, self-collected data on household deposit rates from German banks and bank balance sheet data. I find that over 30% of German banks implemented a negative household deposit rate of -0.5% between May 2019 and April 2022. These banks experienced a 3% reduction of household deposits within twelve months, despite largely generous exemption limits. Banks that adopted negative rates significantly increased their lending activity. This demonstrates that the bank lending channel of monetary policy remains active under negative policy rates.
